Wutwthr | Mini project

What is it?
A shell script that show the current weather conditions of the place if it was passed via command line argument else current weather conditions of the user's current location.
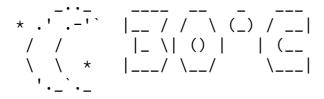

How does it works? (basic outline)
1. $1 is defined
    ? $placeName = $1 and get $placeeLatLong of $placeName by passing $place as search parameter to locationiq.com api
    : get $placeLatLong and $placeName of user's current location from locationiq.com api which will use user's ip address via http request headers
2. get $weather by passing $placeLatLong to darksky.net api
3. print weather details in accordance to $weather

How does the output look?

```
                              _                    _     _
                             | |                  | |   | |
    __        __ _     _   _ | |_  __            __| |_  | |__    _ __
